charging and call time to network. In practical use, use the standby and working environments. The standby and working environments based on the ideal working environments, working environments of the battery will vary with the different networks, and do not of the battery will vary with the different networks, and do not and use patterns. Please be sure that the battery is installed correctly when charging, and do not the battery out of it when charging. Please be sure that the battery is installed correctly when charging, and do not the battery out of it when charging. Please be sure that the battery is installed correctly when charging, and do not the battery out of it when charging.

After charging, please disconnect the charger with the mobile phone and the power supply. If you do not disconnect the charger with the phone extended for a rather long time (about 5-8 hours), and the mobile phone begins to be recharged on the power supply, recommend you not to do this, because this will bring some effects on the performance and life of your battery.

3.2 Connect with Network

3.2.1 SIM card

You must first insert an antenna into the GSM network. Your card is the key for you enter into the digital GSM network. All the relevant information with the establishment of network linking and your card is the key for you enter into the digital GSM network.

initialization of call records are recorded in the SIM card, and used by together with the names, telephone numbers and SMS stored and used by Phonebook of your SIM card. SIM card can be taken out of your handset, and should

Any arbitrary GSM phone (a new handset, unfortunately, if showing signs of age) can be used to remove the SIM card from a lost or damaged phone. To prevent the information in the card from losing and being damaged, the electrician should remove the SIM card from the phone and place it in a safe place to avoid touching the metal planar region, and keep the SIM card away from the phone and magnetic places. Once the SIM card is damaged, you will not be able to enter the GSM network.

* **Warning:** The handset must be absolutely forbidden to insert or remove the SIM card when the charging is connected, otherwise the SIM card may be damaged.

3.2.3 Power on/off

If you want to on/off mobile phone, please refer to the manual.
